                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises an antisense oligonucleotides that are targeted antisense acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Coneryme A (HMG-COA) reductase, and inhibits the expression of HMG-COA reductase. The novel compounds the used to treat disorders by antisense gene therapy. The compound can be used to treat disorders by antisense gene therapy. The compound can be used to treat disorders by antisense gene therapy. The compounds compositions and methods are useful for treating a disease or condition associated with HMG-COA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-COA reductase. This polymucleotide sequence represents an antisense oligonucleotide of the

The present invention relates to an oligomucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligomucleotide and optionally surfactant operatively linked to the oligomucleotide. The method is useful for preventing or treating a cligomucleotide the method is useful for preventing or treating a ceptratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligomucleotide is useful for production of a medicament for the prevention and/or treatment useful for production of a medicament for the prevention and/or treatment cof a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded repiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CRDS), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pullmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligomucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(iss), asthma, impeded consen from airway inflammation, allergy(iss), asthma, impeded consen from airway inflammation, allergy (iss), asthma, impeded consenting chinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

                                                                                                                                                                                                                                                                               The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; primer; diagnosis; cervical intraepithelial neoplasia; CIN; allelic deletion; FHIT; fragile histidine triad gene; PR; progesterone receptor; DLBC1; deleted in lung and oesophageal cancer 1; TRIM29; tripartite motif-containing 29; microsatellite; D3S1300; D3S1260; D1SS35; D1ISS28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing cervical intraepithelial neoplasia comprising detecting an allelic deletion in genes selected from FHIT, PR, DLEC1- or TRIM 29 by comparing the FHIT, PR, DLEC1 and/or TRIM 29 polynucleotides or proteins present in the samples.
Treating airway hyperresponsiveness or pulmonary inflammation comprises administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein to the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar moiety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating alrway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hyperresponsiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. ```

```
This sequence represents a primer which was used in the method of the invention for diagnosing susceptibility to persistence or progression of cervical intraspithelial neoplasia (CIN) in an individual suffering from the disease. The method comprises detecting an allelic deletion in one or compares selected from FHIT (fragile histidine triad gene), PR (progrestorone receptor), DLECI (deleted in lung and ossophageal cancer 1) or TRIM29 (tripartite motif-containing 29) by comparing the FHIT, PR, DLECI and/or TRIM29 polynucleotides or proteins present in the samples contributed from non-dyskaryotic and dyskaryotic samples, respectively. The method is carried out using a kit comprising a panel of two or more pairs of primers, where each pair of primers is suitable for amplifying a microsatellite DNA marker selected from DS31260, D351260, D1835 or D118528, or a panel of two or more specific binding agents, where each contributed distinguishing between the normal and allelic deletion forms of a polynucleotide or protein selected from FHIT, PR, TRIM29 or DLECI. The method is useful for diagnosing susceptibility to persistence or progression of cervical intraeplihalial neoplasia in an and individual suffering from the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense therapy; human; Fas; Fas ligand; FasL; Apo-1L; CD95L; Fas associated protein 1; Fap-1; signal transduction; autoimmune disease; inflammatory disease; cancer; immunosuppressive; antiinflammatory; cytostatic; phosphorothioate; ss.

The present invention relates to antisense compounds targeted to nucleic acids encoding human Fas (also known as Apo-1 or CD95), Fas ligand (FasL, also Apo-1L and CD951), and Fas associated protein 1 (Fap-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits Fas, FasL or Fap-1 mediated signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified anciented antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified matery diseases, and cancers associated with overexpression of constitutive activation of Fas, FasL, or Fap-1. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunosuppressive; antiinflammatory; hepatotropic; virucide; cytostatic; antisense technology; Fas; Fas ligand; Fap-1; Fas associated disorder; pap-1 associated disorder; ischaemia reperfusion injury; apoptosis; allograft; autteimmune disease; inflammatory disease; hepatitis; cancer; lymphoma; human; antisense oligonucleotide; ss.

The invention describes an antisense compound 8-30 or 8-50 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding Fas, Fas ligand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent, a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Fap-1; anda preventing allograft recipient. The antisense compound and pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammatory disease. G. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis, allograft rejection, e.g. cardiac, real, hepatic or skin allograft rejection, injury. This sequence
                                                                                                                                                                                                 New antisense compound targeted to nucleic acid molecule encoding Fas or Fap-1, useful in diagnosing, treating or preventing autoimmune or inflammatory disease, cancer, apoptosis, allograft rejection or ischemia reperfusion injury.
                                                                                                                                                                                                                                                                                                          Example 18; SEQ ID NO 153; 83pp; English

WPI; 2004-293804/27.

Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. asthma.

Claim 2; SEQ ID NO 575; 174pp; English

The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region to codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding interleukin (11.0-4 receptor, interleukin (11.0-5) receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The cligonucleotides are useful for reducing or inhibiting expression of a cligonucleotides are useful for reducing or inhibiting expression of a creapiratory or lung disease. The creapiratory or lung disease are useful for preventing or treating a respiratory or lung disease. The creapiratory or lung disease is associated with hyper-responsiveness to cadhor increased levels of, adenosine and/or lung allergie associated with creapiratory or lung disease conformation or an inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CC is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (CDPD), contractive and contractive pulmonary disease (CF) thouse of the proper and contractive pulmonary disease (CPPD) thouse the contractive pulmonary disease (CPPD) the contractive pulmonary disease (CPPD), chronic obstructive pulmonary disease (CPPD) the contractive descriptor or the contractive descriptor or the contractive descriptor o pronchoconstriction. This sequence represents an oligonucleotide of

```

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 mucleotides of the 5'-end or 3'-end of a mucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 A, PDB4 B, PDB4 C or PDB4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The cligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 B, PDB4 C, or PDB4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(8), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

ö

to ADAMIS (otherwise known as metagirdin, MDC15, and a disintegrin and metalloproteinase domain 15) and which modulate the expression of ADAMIS. The invention is useful for diagnosing and treating diseases associated with expression of ADAMIS such as inflammation. The present sequence is human ADAMIS target oligonucleotide. This sequence is used in the exemplification of the invention.

Sequence 20 BP; 6 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

The present invention is directed to antisense oligonucleotides targeted

Example 15; SEQ ID NO 73; 38pp; English.

e.g

CCR1

New compound targeted to a nucleic acid molecule encoding ADAM15 and inhibits the expression of ADAM15, useful for modulating the expression of ADAM15 or for diagnosing or treating, e.g. inflammation.

The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the described are: a method of inhibiting the expression of thinase. Also described are: a method of inhibiting the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase, comprising operating a preferred target or more candidate modulators of Cytokine-inducible kinase, and comprising contacting a preferred target segment of the nucleic acid encoding Cytokine-inducible kinase with one or more modulators that modulate the expression of Cytokine-inducible kinase, and candidate modulators of Cytokine-inducible kinase with one or more modulators that modulate the expression of Cytokine-inducible kinase in a sample using at least one of the primers or probe comprising the action associated with Cytokine-inducible kinase in a sample using at least one of the primers or probe comprising the above compound; and a method of treating an animal having a disease or condition associated with Cytokine-inducible kinase is inhibited. The antisense oligonuclecide is useful for inhibiting the expression of Cytokine-inducible kinase is inhibited. The antisense oligonuclecide is useful for inhibiting the expression of expression of expression or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is inhibited. The antisense oligonuclecide is useful for inhibiting the expression of expression or prophylactic amount of the compound so that expression of cytokine-inducible kinase is inhibited. The antisense oligonuclecide is useful for inhibiting the action of the compound so the expression of cytokine-inducible kinase is inhibited. The antisense oligonuclecide is useful for inhibiting the expr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              treat diseases associated with the kinase expression, such as hyperproliferative disorders. In addition, the compound is used for disquostics, prophylaxis, or as research reagents or kits. This sequence represents a human cyctokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g. hyperproliferative disorders.
/note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. heatt, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatorid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.

Identifying a subject at risk of breast cancer comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of identifying (MI) a subject at risk of breast cancer. The method comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The methods, nucleic acids, proteins, and compositions are useful for diagnosing, preventing, and treating breast cancer. Also described is a method useful for identifying candidate therapeutics for treating breast cancer. This sequence

The invention relates to treating an inflammatory disorder in an individual comprising administering an oligonucleotide (an antisense cligonucleotide) up to 30 mucleotides in length complementary to a nucleic acid molecule encoding human tumour necrosis factor-alpha (TNF-alpha). The oligonucleotide useful in treating an inflammatory disorder inhibits the expression of the human tumour necrosis factor-alpha (TNF-alpha). The oligonucleotide usequences, given in the specification. The antisense oligonucleotide is equences, given in the specification. The antisense oligonucleotide is comprises at least one modified intersugar linkage. The intersugar linkage is a phosphorothioate linkage. The oligonucleotide further comprises at least one 2'-O-methoxyethyl modification and at least one 5'-methyl cytidine, where every 2'-O-methoxyethyl modified cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine. The modified intersugar linkage is a methylene (methylimino)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             intersugar linkage. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the TNF-alpha, such as inflammarcry, infectious and autoimmune diseases, including diabetes, rheumatoid arthritis, Crohn's disease, pancreatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating inflammatory disorders, such as diabetes, rheumatoid arthritis and multiple sclerosis, using antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor-alpha (TNF-alpha).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       including diabetes, rheumatoid arthritis, Crohn's disease, pancreatitis, multiple sclerosis, atopic dermatitis, inflammatory bowel disease, colitis and hepatitis. The present sequence is an antisense

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a double stranded RNA compound 8-80 nucleobases
in length targeted to a nucleic acid molecule encoding human TNF-alpha,
where the compound specifically hybridises with the nucleic acid molecule
encoding TNF-alpha and inhibits the expression of survivin. Also
described is a double stranded RNA compound having a fully defined
sequence of 20 bp (SEQ ID NO: 432) as given in the specification. Also
disclosed are TNF-alpha polypeptides, host cells, vectors and antibodies
used in the methods of the invention. The methods and compositions of the
present invention are useful for the diagnosis, prevention and/or
treatment of diseases or conditions associated with aberrant expression
treatment of disease, pancreatitis, multiple sclerosis, atopic
dermatitis and hepatitis. This sequence represents a human tumour
ecrosis factor alpha (TNF-alpha) antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                     new notable stranded RNA compound inhibiting expression of human TNF-alpha and survivin, useful for diagnosing, preventing or treating infection, diabetes, arthritis, multiple sclerosis and hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; tumour necrosis factor alpha; TNFalpha; ss; antisense gene therapy; inflammatory disorder; phosphorothioate linkage; methylene(methylimino) intersugar linkage; infection; autoimmune disease; diabetes; rheumatoid arthritis; Crohn's disease; pancreatitis; multiple solerosis; atopic dermatitis; inflammatory bowel disease; colitis; hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                       The invention provides methods for identifying an Epstein Barr Virus (EBW) infection, that comprises detarmining viral gene transcription patterns by amplification of specific RNA sequences. The binding sites of the oligos suitable for amplification are located in the following genes: Epstein Barr early RNA (EBER-1), Epstein Barr nuclear antigen 1 (EBNA-1). Elatent membrane protein 1 (LMP-1), LMP-2, and vILIO (BCRF-1), BARF1 and BDLF2. The method comprises (a) amplifying a target sequence within one or more RNA(s) transcribed from above gene sequences and the (b) and identifying the amplified products, determining the transcription pattern and identifying a transcription based amplification technique such as amplified using a transcription based amplification technique such as succiated diseases. Sequences AAZI1672-75 represent oligos specific for BARF-1 RNA. (Updated on 27-AUG-2003 to correct OS field.)

AAV72085-V72099 represent PCR primers and probes used in the isolation and amplification of novel human and murine macrophage stimulating protein, MSP, which are used in a method for the prophylactic treatment of a tumour derived from neuroendocrine cells (NEC) by administration of this MSP to a subject at risk, sufficient to induce apoptosis of NEC expressing a RON receptor (the receptor for MSP). The method is used to treat or prevent small cell lung carcinoma and apoptosis of RON-expressing cells may be induced in vivo or in vitro. Screening NEC from subject for susceptibility to MSP-induced apoptosis is used to identify patients who will benefit from treatment with the MSP protein. MSP is already known for treating pathogen infections, for stimulating thrombocytopaenia) and for stimulating growth of cells (particularly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-JUN-2001;
The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLIA1 gene extending in the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent consecutive nucleotide and a first and second site, obstrion contains an intronic nucleotide and a first and second site, determining the sequence of the portion and comparing the sequence of the portion with the corresponding consensus sequence of the COLIA1 gene where a difference between the sequence of the portion and the consensus sequence in the presence of the portion and the consensus sequence indicates the presence of the collagen alteration in the subject. The method is used for detecting abnormalities in a COLI or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple companies of the collagen gene such as osteoporosis, multiple companies of the consensus of stature and companies of section of an abnormality in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent conding and non-coding sequences of any of the COLIA or COL9 genes.

Therefore the method can be used to detect collagen gene alterations in both the coling and non-coding sequences of any of the COLIA or COL9 genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of
                                                                                                                                                                                                                       Detecting collagen gene alteration, useful for diagnosing osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the genes encoding such chains. The present sequence is a PCR primer which amplifies a nucleic acid from a collagen gene of the invention

obesity or cancer.

Peyman JA; , Stone DJ;

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences (see ADH48717-ADH48930). The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. The present sequence was used in an example from the invention. Example 2; Page 855; 923pp; English.

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                   The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myozaditis, meningitis, neurologic infection, hepaticis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 0.4%; Score 15.4; DB 1; Length 17; Best Local Similarity 82.4%; Pred. The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; viruoids; neuroprotective; antibacterial; replication; panoreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WNV minus strand Inozyme substrate SEQ ID NO 9951.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17 BP; 2 A; 7 C; 4 G; 0 T; 4 U; 0 Other;

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive uncleotides from the 17 mer sequence, a sequence with, after optimal alight and the specification, a sequence with, after optimal alight and primars for them the 17 mer sequence. The sequence that the single to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cides of the invention are useful as probes and primers for detecting, dentifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the nucleic acids, cells containing the nector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral degeneration, specifically cancer but also Alzheimer's disease and containing the expression of the 17 meruleic acids in patient samples is useful for disposis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression containing the related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

treating cirrhosis, liver failure, or condition associated with hepatitis C virus Example 1; Page 184; 387pp; English compound useful for hepatocellular carcinoma, infection.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, amberzymes, anderzymes, anderzymes, anderzymes, anderzymes, anderzymes, anderzymes, and stability of cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV COMPOUNDS and HBV repeased and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds maddisate the expression and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV infectionme, inosyme, declaryme, inosyme, declaryme, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention

Sequence 17 BP; 4 A; 4 C; 3 G; 0 T; 6 U; 0 Other;

0.4%; Score 15.4; DB 1; Length 17;

The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, acids are combination with other therapies such liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and
that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as circhnosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes

The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in
mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  virus and comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                        ö
a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; reetenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a preferred target sequence for an tenzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatorid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection; nucleic acid; aqueous solution; length analysis; repeat unit; microsatellite marker; repetitive element; microorganism; probe; genotyping; clinical diagnosis; quantification; sequencing; mutation; ss.

A new method for detection of nucleic acids in aqueous solution is claimed, which may be used for length analysis of repeat unit containing sections of microsatellite markers or other repetitive elements. The method may also be used for microorganism detection, parallel detection of several target nucleic acids using several primer pairs for enzymatic amplification and/or several differently labelled detection probes and/or ard probes, genotype determination, determining relatedness of organisms, clinical diagnosis, food chemistry, anthropology, forensic analysis, specific quantification of nucleic acids, determining the RNA concentration of tumour markers, determining nucleic acid sequences for antigenic determinants, nucleic acid sequence analysis, antigenic determinants genetic changes involved in the development of drug resistance. AATG1997-G2000 are species specific probes for detection of Auxis thazard using the new method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide sequences which bind nuclear proteins and surfactants found in lung cells, useful for detecting cancers that originate in the

The invention relates to an oligonucleotide which includes at least 1 nucleic acid sequence which binds to at least 1 nuclear protein found in lung cells (e.g. the thyroid transcription factor 1, TFF-1, protein). The oligonucleotide can be expressed in lung cells via a vector and can be used to target therapeutic agents to kill lung or thyroid cancer cells. The oligonucleotide can be used to detect or diagnose lung or thyroid cancer. The oligonucleotides may be designed from the sequences of, for

The oligonuclectide can be expressed in lung cells via a vector and can be used to target therapeutic agents to kill lung or thyroid cancer cells. The oligonucleotide can be used to detect or diagnose lung or thyroid cancer. The oligonucleotides may be designed from the sequences of, for example, the promoters of lung specific genes such as those encoding surfactant proteins. The present sequence is a Human surfactant protein B, SPB, probe 5/fl based on the SPB-fl probe and is used to identify TTF-1 and HNF-3 binding sites in the SPB promoter using EMSA, electrophoretic
                                                                                                                                                                             ö

New nucleic acid, useful in imparting disease resistance to a plant or in preparing a composition for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  py. tomato D23000 Avr/Hop proteins, and the polynucleotide sequences encoding them. Also disclosed are expression vectors, host cells, and transgenic plants comprising polynucleotide sequences of the invention. The polynucleotide and polypeptide equences are useful in imparting disease resistance to a plant or in preparing a composition for treating cancer. The sequences may also be used to make a plant hypersusceptible to colonisation by nonpathogenic bacteria, modify a metabolic pathway in a cell, cause eukaryotic cell death, and inhibit programmed cell death. The present sequence represents a PCR primer used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention relates to the isolation of Pseudomonas syringae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.

The invention relates to novel Pseudomonas Avr and Hop genes, a sequence that hybridizes with these sequences under stringency conditions comprising a hybridization medium that includes 0.9 x saline sodium citrate (SSC) buffer at a temperature of 42 deg C. The nucleic acid molecule is useful for preparing a composition for treating cancer. This sequence corresponds to a PCR to isolate and amplify one of the genes of

The sequences given in AAQ41826-61 represent sequences which are bound in an electrophoretic mobility shift assay (EMSA) by Myc. The isolated consistences contain the central E box core of CAGGTG which binds very weakly with Myc homo-oligomers (C1 complex), but more tightly with Myc homo-oligomers (C2 complex), but more tightly with Myc complex. The C2 complex but more tightly with Myc and c1 in addition to Myc. The additional factor copurifies with Myc and c1 resembles Max protein. A second copurifying 40-50 kD factor has been c1 dentified (forming C2 complex). Sites selected by the C2' complex contain the core CACCTG which bears remarkable homology to a myogenin binding site (see AAQ41763). Oligonucleotides containing the E box can be used in the purification of Myc from a mammalian source. See also capadated target sequences may be used in a method to inhibit c-Myc oncoprotein activity. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                             ó,
                                                                This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Prodn. of c-Myc protein from mammalian cells - and detection of c Myc inhibitors for use in cancer therapy.
                                                                                                                                                                                                                                             Gaps

These ORFS encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, perior protections and properties of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                         Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.

This sequence represents an antisense oligonucleotide sequence which targets a region of the human tumour necrosis factor alpha (INFalpha)

targets a region of the human tumour necrosis factor alpha (INFalpha)

mucleotide sequence. TNFalpha is an important cytokine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that repersented by the present sequence which are capable of modulating the TNFalpha gene expression. The oligonucleotides of prionally have a phosphorothicate backbone, and may also optionally contain at least one 2'-0-methoxyethyl modification. The oligonucleotides are useful for modulating the expression of human TNFalpha in cells and tissues, reducing a human cell inflammatory cresponse, reducing the blood glucose level in a human and treating thuman having a disease or condition associated with TNFalpha include diabetes, inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease, multiple sclerosis, pancreatitis, rheumatoid arthritis, infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligonucleotides are also useful for modulating the

The PCR product is used in the method of the invention for determining susceptibility to bone damage. The method comprises screening for polymorphisms in the vitamin D receptor (VDR) gene or the Collagen I-alpha-1 gene. The the presence of alleles A and/or I, and especially the haplotype baT, are associated with an increased risk of bone damage and a higher risk of bone fracture. The methods are used for determining the susceptibility to bone damage and osteoporosis. Done damage may be any form of structural damage, including fractures, breaks or chips. Identification of those at risk using the method of the invention, allows for preventative measures to be taken, such as modifications to lifestyle, regular exercise, and changes in diet to strengthen bones, and hormone therapy. The present invention allows more effective preventative measures to be taken ; 0 PCR primer; vitamin D receptor; susceptibility; bone damage; polymorphism; increased risk; osteoporosis; structural damage; fracture; break; chips; hormone therapy; prevention; collagen I-alpha-1; ss. ```
amplification of a gene selected from the group consisting of Vibrio parahaemolyticus direct haemolysin-related thermostable haemolysin genes (trh) and trh2) and V. parahaemolyticus thermostable direct haemolysin gene (tdh2) or RNA derived therefrom. These oligonucleotides are useful as probe and primer for detection or amplification of V. parahaemolyticus examination, public hygiene, food evaluation or food poisoning evaluation. The present sequence is a primer used to amplify V.
New oligonucleotides as primers and probes, useful for detection or amplification of Vibrio parahaemolyticus thermostable direct hemolysin-related hemolysin genes or RNA derived from them.

Determining susceptibility of human patient to hereditary pancreatitis comprises analyzing nucleic acid from patient for presence of mutation in third exon of cationic trypsinogen gene that indicates hereditary pancreatitis.
                                                                                                                                                                                                        The specification describes a method for determining whether a human patient is susceptible to hereditary pancreatitis (HP). The method comprises obtaining nucleic acid from the human patient and analysing the nucleic acid to identify the presence of a single G to A transition mutation in codon 117 in a third exon of a cationic trypsinogen gene, or a single A to T transition mutation at codon 21 in second exon of a cationic trypsinogen gene, that indicates HP. The method is useful for determining whether a human patient is susceptible to HP. The present sequence represents an oligonucleotide, which is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour necrosis factor alpha; TNF-alpha; antiinflammatory; antirheumatic; antidiabetic; dermatological; hepatotropic; antidiabetic; inflammatory bowel disease; Crohn's disease; colitis; rheumatory at all disease; colitis; rheumatoid arthritidabetic; alphacetics; pancreatitis; multiple sclerosis; atopic dermatitis; aschma; hepatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to new methods for determining susceptibility of a subject to bone damage comprise determining which allele(s) of polymorphisms in methyltetrahydrofolate reductase (WTHFR) and collagen lalphal are present in the subject, or measuring level of serum homocysteine in the subject, where elevated level compared to a reference population indicates susceptibility. Also included are determining the susceptibility to bone damage in a subject identified as having the s
                                                                                                          The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonaclectide upto 30 nuclectides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and happatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor
Crohn's disease or rheumatoid arthritis, in a subject, by administering oligonucleotide which inhibits expression of human tumor necrosis factor alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, 88; collagen IalphaI, SNP, single nucleotide polymorphism;

allele of the Spl polymorphism in collagen Ialphal, preventing or reducing susceptibility to bone damage in a subject (comprising prescribing or administering folic acid to a subject at risk for bone damage), preventing or reducing bone damage (comprising determining that a subject as increases susceptibility to bone damage, and prescribing or administering folic acid to the subject, and predicting response of subject to treatment (comprising determining which alleles of the MTHFR and/or collagen Ialphal are present). The invention is useful to prevent or reduce risk of bone damage (e.g. osteoporosis) by treating subjects determined to be susceptible with folic acid. The present sequence is a per primer used to amplify the polymorphic region of the human collagen
                                                                                                                                                                                                                                                                                                                                                   IalphaI gene.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 2652; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchoditation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

WPI; 2003-093058/08.

ţ Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 2652; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating

```
The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition camprises oligo and is administered to reduce the production comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, and or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchists or cancer.

The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
   expression of a target polypeptide associated with lung airway or lung
                               dysfunction or cancer and can be anti-sense to the corresponding mRNA

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises an antisense oligonucleotides that are targeted antisense acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NoTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                         DNA

The invention relates to antisense compounds, compositions and methods for modulating the expression of selenophosphate synthetase 2 (SPS2). The composition comprises antisense oligonuclectides targeted to SPS2 gene. The antisense oligonuclectide is useful for modulating the expression of SPS2 in cells or tissues to treat diseases associated with their expression, e.g. rheumatoid arthritis, infections, inflammation or tumours. It is also used for diagnostics, prophylaxis, or as research reagents or kits. The antisense oligonuclectide is useful in antisense therapy. The present sequence is an antisense oligonuclectide targeted to human SPS2 DNA. This sequence is used in the exemplification of the
                                                                                                                                                                                              New antisense oligonucleotides for modulating selenophosphate synthetase 2 (SPS2) expression, useful for diagnosing, preventing or treating conditions associated with SPS2, e.g. rheumatoid arthritis, inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytostatic, cancer, antisense, human telomerase, cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human telomerase antisense sequence related oligonucleotide #5

/note= "Phosphorothioate backbone and all cytidines are 5
-methylcytidines"
New polynucleotide directed against the gene for telomerase catalytic subunit, useful for diagnosis and treatment of solid tumors and leukemia, interacts with specific regions of the mRNA.
                                                                                                                                                    least two target sequence regions, i.e. 2176-2250 and 2296-2392 of the sequence AF015950. The polynucleotides are used for diagnosis, prophylaxis, treatment, monitoring (of progression or therapy) and/or secondary treatment of diseases associated with growth, differentiation and/or division of calls, especially a very wide range of solid cancers and leukaemia, or their metastases, e.g. cancers of the urogenital or gastrointestinal tracts, liver, breast, prostate and bladder. They can also be used to inhibit vitality or proliferation rates of cells, to induce apoptosis and/or cause cell-cycle arrest. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        death-associated protein kinase-rel. apoptosis-inducing protein kinase; serine/threonine kinase 17B; STK17B; apoptosis; degenerative disorder; neurological disorder; Alzheimer's disease; Parkinson's disease; Amylotrophic lateral sclerosis; ALS; retinitis pigmentoss; blood cell disorder; cancer; autoimmune disorder; viral infection; gene therapy; hyperproliferative disorder; chromosome 2.
                                                                                                   The present invention relates to a polynucleotide, directed against a gene that encodes a catalytic subunit of human telomerase, which interacts with the mRNA of the catalytic subunit of telomerase in at
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a new compound (e.g. an antisense oligonuclectide), having a sequence comprising 8-80 bp targeted to a nucleic acid encoding DRAKZ (death-associated protein kinase-related apoptosis-inducing protein kinase 2, also known as serine/threonine kinase 17B, STK17B), specifically hybridises with the nucleic acid encoding DRAKZ (appearing as ADF68859 and representing bases 58695-149492 of human chromosome 2) and inhibits expression of DRAKZ. Also included are inhibiting the expression of DRAKZ, in cells or tissues, screening for a modulator of DRAKZ, a diagnostic method for identifying a disease of state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with DRAKZ. The coligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorders, degenerative disorders, contential statemer's disease, parkinson's disease, controphic lateral sclerosis (ALS), retinitis pigmentosa, blood cell disorders, cancer, autoimmune disorders and viral infection. The present sequence represents an antisense oligonucleotide targeting DRAKZ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antimicrobial; antidiabetic; antirheumatic; antiarthritic; gastrointestinal; antiinflammatory; neuroprotective; dermatological; virucide; hepatotropic; human; TNF-alpha; tumour necrosis factor alpha; survivin; TNF-alpha associated disorder; infection; diabetes; rheumatodi archritis; crohn's disease; pancreatitis; multiple sclerosis; atopic dermatitis; hepatitis; antisense oligonucleotide; sclerosis; antisense technology; ss.

The invention describes a double stranded RNA compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding human TNF-alpha, where the compound specifically hybridises with the nucleic acid molecule encoding TNF-alpha and inhibits the expression of survivin. Also described is a double stranded RNA compound having a fully defined sequence of 20 bp (SEQ ID NO: 432) as given in the specification. Also disclosed are TNF-alpha polypeptides, host cells, vectors and antibodies used in the methods of the invention. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of TNF-alpha, such as infection, diabetes, rheumatoid arthritis, Crohn's disease, pancreatitis, multiple sclerosis, atopic dermatitis and hepatitis. This sequence represents a human tumour necrosis factor alpha (TNF-alpha) antisense oligonucleotide.
                                                                                                                     and survivin, useful for diagnosing, preventing or treating infection, diabetes, arthritis, multiple sclerosis and hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; tumour necrosis factor alpha; TNFalpha; ss;

This sequence represents a primer which was used in the quantitation of the distribution of prostaglandin E2 EP3 III polypeptide. The prostaglandin E2 EP3 III polypeptide and corresponding nucleic acid may be used for screening therapeutic agents for treating disease such as hematological diseases, cardiovascular diseases, usological diseases, cancer, or respiratory diseases in a mammal. The methods comprise detecting binding of a test compound to a prostaglandin E2 EP3 in polypeptide or polymeticaledide, determining activity of prostaglandin E2 EP3 III polypeptide at different concentrations of test compound; or determining activity of prostaglandin E2 EP3 III polypeptide. The regulators of prostaglandin E2 EP3 III polypeptide.

CC presence of a regulator of prostaglandin E2 EP3 III polypeptide. The regulators of prostaglandin E2 EP3 III seases, metabolic diseases, endocrinological disease, metabolic cancer, or respiratory diseases, gastroenterological diseases, and shall for the disease, endocrinological diseases, metabolic cancer, or respiratory diseases, metabolic cancer, or respiratory diseases, and mammal. They are also useful for the disease.
                                                                                                                                                                                                                                                                                                                                          Screening agents for treating, e.g., cancer by detecting binding of compound to prostaglandin B2 EP3 III protein or polynucleotide, determining activity of E2 EP3 III in presence of regulator and/or compound at varying concentrations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 4 A; 4 C; 6 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to treating an inflammatory disorder in an individual comprising administering an oligonucleotide (an antisense coligonucleotide) up to 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumour necrosis factor-alpha (TMF-CC alpha). The oligonucleotide useful in treating an inflammatory disorder comprises at least as 8 nucleobase portion of any of 50 20-21 base pair sequences, given in the specification. The antisense oligonucleotide is administered orally, topically or parenterally. The oligonucleotide is comprises at least one modified intersugar linkage. The intersugar linkage is a phosphorothicate linkage. The oligonucleotide further comprises at least one 2'-O-methoxyethyl modification and at least one 5'-O-methoxyethyl modified cytidine residue is a 5-methyl cytidine, where every cytidine residue is a 5-methyl cytidine, and where every cytidine seature (is a 5-methyl cytidine and the modified intersugar linkage is a methylene(methylimino) cr incrsugar linkage. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the TNF-CC alpha, such as inflammatory, infectious and autoimmune diseases, contitions and hepatisis, theopression and autoimmune disease, pancreatitis, including diabetes, rheumatoid arthritis, crohn's disease, pancreatitis, colitis and hepatisis. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                       Treating inflammatory disorders, such as diabetes, rheumatoid arthritis and multiple sclerosis, using antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor-alpha (TNF-alpha).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

DNA or RNA was purified from white blood cells of patients with acute leukaemia or solid tumour cells; the RNA was reverse transcribed into cDNA. The downstream primer (AAQ21515) was used together with this primer which has a mutant-specific nucleotide at its 3' end to amplify a region of exon 4 of the CTP synthetase gene. A specific signal will only be seen with samples contry. The mutant gene. See AAQ21488 and AAQ21512 for upstream primers which can be used with other primers specific for mutations in exon 4. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding cpds. which catalyse de-acetylation - and sulphation of glycosamino-glycan(s), used to develop agonists or antagonists for use in

                                                          N-heparan sulphate sulphotransferase can catalyse the deacetylation and sulphation of a glycosaminoglycan (GAG), namely heparan sulphate. It can be used for treating conditions in which the stimulation or inhibition of the deacetylation and or sulphation of heparan is desirable, such as blood clotting disorders, neoplastic conditions and viral infection. The enzyme can also be used to produce highly modified and therefore highly active sulphated proteoglycans for use in therapy. This primer was used to amplify a subclone of the enzyme coding sequence to produce a probe. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosis of X-linked severe combined immunodeficiency (XSCID) - comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAQ71911 to AAQ71975 are primers for the human IL-2R gammma gene, these were used to amplify DNA from mutated and normal IL-2R gamma genes. The mutated gene DNA was obtained either from female carriers or male sufferers of X-linked severe combined immunodeficiency (XSCID). The amplified DNA from normal and affected individuals was then compared using a variety of methods including northern blotting and dot and slot hybridistation. From this a claimed method for the diagnosis of XSCID carriers and sufferers was developed. (Updated on 25-MAR-2003 to correct PN field.)

The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising are shown in AAQ95687.734. The published size range of the DNS. Is allele as the control of the DNA. Group 7 primer pairs are shown in AAQ95687.734. The published size range of the DiSSII8 allele is a 118-120 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of disease related genetic rearrangement.

AAT47264-T47280 represent capped RNA molecules produced by the method of the invention. The method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue mono-, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the clawayse of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of capped RNA or analogues - useful as substrates for influenza virus associated virally encoded endonuclease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

The primers AAV59158-V59159 were used to detect a point mutation in a p53 agene as an example of the method of the invention to Detect mutant alleles among an excess of wild-type alleles. This is carried out by separating the wild type alleles using a carrier on which are bound one or more oligonucleotides complementary to the wild type. The method is invest to detect mutants having one or more point mutations, deletions, inversions, insertions and/or substitutions of small arge genetic regions, particularly to detect genetic abnormalities for cancer diagnosis. The method can detect cancer cells in faeces, sputum, bronchial lavage, urine or tissue biopsies. Rare alleles can be detected, making the method suitable for detecting heterozygous or homozygous mutations or polymorphisms of any origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                Detecting mutated alleles in presence of excess wild-type allele - by separation of wild-type on support carrying specific oligonucleotides, used to detect mutation(s), particularly for cancer diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primer used to amplify an ORF of Chlamydia trachomatis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.4%; Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT89689-T89744 are individually claimed oligonucleotides used as PCR (polymerase chain reaction) primers for the discrimination of the genotype of hepatitis C virus (HCV). Classification of the genotype of HCV can be achieved precisely and simply according to the International Standardisation of Classification. The primers can be used to distinguish between HCV genotypes la, lb, 2a, 2b, 3a, 3b, 4, 5a, 6a and 6b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primers used for determining hepatitis C virus genotype - provide a rapid and accurate method of hepatitis C virus genotyping.

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, preumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 6 A; 6 C; 3 G; 5 T; 0 U; 0 Other;

Genome sequence of Chlamydia pneumoniae.

Page 1533; Disclosure; 1912pp; English.

Sequences AAAA195-ABOR Expessent phosphorocinoate antisense coligonucleotides targetted to the human MEKES gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human MEKES RNA, and were analysed for their cffect on MEKES manA levels by quantitative real-time PCR. MEKES (also known as mitogen-activated protein kinase kinase 5, MEK kinase 5, apoptosis signal-regulating kinase 1, and ASK1) is a dual-specific serine/threonine kinase which mediates cellular ceminal kinase/stress-activated protein kinase) and p38 modules of MAP KN cerminal kinase activated protein kinase) and p38 modules of MAP kinase cascades. MEKES is thought to play a critical role in the cegnistion of apoptosis (programmed cell death) by interacting with other regulation of apoptosis (programmed cell death) by interacting with other as MKK3 and SEKI. MEKK5 is proteined of mornistiant of MEKK5 is induced by tumour necrosis factor as MKX3 and SEKI. MEKK5 is participates in another apoptosis-related signalling cascade involving the modulation of transcription factors. Activation and dimerisation of MEKK5 is induced by tumour necrosis factor—alpha (TNF-alpha), these processes being mediated by recoiles of the invention and dimerisated with MEKK5 and inhibit MEKK5 conditions associated with MEKK5 expression, such as inflammation and wound healing disorders

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34844- AAX3879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ATM; ataxia telangiectasia; mutation detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothioate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetee mellitus, myathenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact

The present sequence is one of a number of primers used in a method for detecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectesia, or a polymorphism in the human ATM gene, which is casociated with the disease ataxia telangiectesia.

Single-stranded conformation polymorphism (SSCP) electrophoresis that allows electrophoresis of two or three amplified segments in a single lane. The method is useful for screening large, complex polyworphisms. The method is useful for screening large, complex polyworphisms. The method is useful for screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening method. The mega-SSCP method provides a screening method of genes for multiple polymorphisms and mutations at once. The method is particularly suitable for large, polyexonic, cukaryotic genes, having mutations and polymorphisms at many points and not merely at one or a few hot spots. Note: the SEC ID assigned to this sequence in the disclosure and claims of the the specification is one
                                                                                                                                             Detecting a mutation or polymorphism in human ataxia telangiectasia gene or polyexonic eukaryotic gene, involves using mega-single stranded comformation polymorphism analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human nucleolin phosphorothioate antisense oligonucleotide, SEQ ID NO:51.

Sequences AAC92560-C92639 represent antisense oligonucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense coligonucleotides were designed to target different regions of the human nucleolin mRNA and were analysed for their effect on nucleolin mRNA levels by quantitative real-time PCR. Nucleolin (also known as P92 or 10.3) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and transport of ribosomeal components, being able to transfently bind to pretribosomes in the nucleolus via a ribonucleoprotein consensus sequence. However, it has also been shown to be involved in cytokinesis, nucleogenesis, cell proliferation and growth, transcriptional repression, replication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar or ganiser region) family of proteins which are markers of active or tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic lupus erythematosus (SLE) and scleroderma-like chronic graft versus host lupus erythematosus (SLE) and scleroderma-like chronic graft versus host greavention and treatment of conditions associated with nucleolin expression, such as tumour formation, immune disorders and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  domain;
                                                                                                               Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a DNA marker associated with obesity and a predictive method of the likelihood of obesity using the DNA marker are provided, used in inhibiting obesity effectively in preventive medicine. The DNA marker associated with obesity has the nucleotide sequence of human LPL (lipoprotein lipase) wherein a 6th base from the origin (+1) of exon 4 in intron 3 of the human LPL is changed from C to T, wherein the base-substituted nucleotide sequence of human LPL comprises a C type allele gene with a MboII restriction enzyme-recognition site, i.e. GAAGA, and a T type allele gene without the MboII restriction enzyme-recognition site. The predictive method of likelihood of obesity comprises the steps of: collecting DNA from a human blood sample; amplifying a region of the intron 3 of the LPL gene in a DNA sample containing a region from -6 to intron 3 of the origin of the exon 4 by PCR; digesting the amplified DNA with MboII; and determining the gene type of the blood sample based on the band size of a digested DNA fragment. The present sequence is a PCR primer used in the above method ö Genetically modified yeast strain, autonomous; metabolism of cholesterol; 17alpha-hydroxypregnenolone; steroid; cortisol; cortexolone; 17alpha-hydroxyprogesterone; ds. New genetically modified yeast, useful for producing therapeutic steroids from simple carbon source, provide high yields at low cost. The invention relates to a genetically modified yeast strain that produces, autonomously from a simple carbon source, a steroid, or its derivative, formed by metabolism of cholesterol. The steroid is 17alpha-hydroxypregnenolone; cortisol; cortexolone or 17alpha-thydroxyprogesterone. The genetically modified yeast strain is used to produce therapeutically useful steroids, and can itself be used as pharmaceutical. This polynucleotide sequence represents an oligomucleotide relating to the steroid producing genetically modified yeast strain of the invention Gaps ä Autonomously steroid producing yeast strain related oligo SEQ ID No Pompon ; 0 0.4%; Score 15.2; DB 1; Length 20; 85.0%; Pred. The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary coligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Appergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Ebstrain-Barr virus and polio virus, and parasitic infectious agents e.g. Ebstrain-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC betecting cancer involving oncogenes, tumour suppressor genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the food and feed industry, detecting comprises scanning (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kliman R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Favis R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the present invention
```

```
The invention relates to antisense oligonucleotides (ACF33752-ACF33779) targeted to the human CREB (CAMP response element binding protein) gene, which inhibit its expression. The oligonucleotides were designed to target different regions of human CREB mENA, and were analysed for their effect on CREB expression by quantitative real-time PCR. CREB (also known as CREB1) is a member of the basic leucine zipper (bZIP) family of transcription factors, and activates transcription of target genes in response to a diverse array of stimuli including peptide hormones, growth factors and protein kinases. It is a component of intracellular signalling events which regulate a wide variety of biological functions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating CREB (CAMP response elemen
binding protein) gene expression, useful for preventing or treating e.g.
cancers, a disease arising from aberrant apoptosis, or neuronal
                                                                                                                                                                                                                                                                                                                                                    Human; CREB; cAMP response element binding protein; CREB1; bZIP; basic leucine zipper; transcription factor; intracellular signalling; spermatogenesis; circadian rhythm; memory; apoptosis; hyperproliferative disorder; cancer; tumour; blood; soft tissue; apoptosis related disease; neuronal disorder; chromosome 2q32.3-34; cytostatic; neuroprotective; expression inhibition; phosphorothioate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   backbone with all cytosine residues being 5-methylcytosines. Optionally, it also has 2-methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length"
                                                                                                                                                                                                                                                                                Human CREB phosphorothioate antisense oligonucleotide, SEQ ID NO:21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= a

including apermatogenesis, circadian rhythms and memory. Overexpression of CREB has been found to induce apoptosis in certain cells, although CREB overexpression may also be linked to cancer as it is constitutively activated in human somatotroph adenomas. CREB may also play a role in the development of drug dependency, as it has been found to mediate morphine-induced upregulation of the CAMP pathways that contribute to opiate dependency. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of CREB-related disorders, such as hyperproliferative disorders (particularly cancer, e.g., those of blood and soft tissue), diseases or conditions arising from aberrant apoptosis, or neuronal disorders. The present sequence represents a human H-ras phosphorothicate antisense oligonucleotide used as a positive control in determining optimal oligonucleotide concentration for a particular cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for treating or preventing cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mcd_base= OTHER
/mcd_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"

complement component C3 and inhibits the expression of complement component C3, or specifically hybridises with at least an 8-nucleobase cortion of an active site on a nucleic acid molecule encoding complement component C3. Also included are a composition comprising complement component C3 in calls or tissues (comprising contacting the component C3 in calls or tissues (comprising contacting the component C3 in calls or tissues (component component C3 in condition associated with complement component C3 comprising administering to the animal the compound cited above so that expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement C3 is component C3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an expression of complement C3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an experience or autoimmune disorder (e.g. multiple sclerosis), an infection, or attended the complement C3 in cells are also useful as research reagents and diagnostics, in distinguishing functions of various members of a biological pathway, or for preventing or delaying the component sequence is an expension or infection, inflammation. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detector for identifying human papilloma virus subtypes, comprises carrier having two parts carrying first and second oligonucleotides that respectively hybridize with DNA contained in first and second subtypes of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human papillomavirus type 33 (HPV 33) detection oligonucleotide #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     probe; human papilloma virus; HPV; detection; identification; ss.

The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrheic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or czema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence represents a human B7-1 targeted oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                        Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.4%; Score 15.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of treating an inflammatory skin disorder in an individual by topically applying an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention is for treating an inflammatory skin disorder in individual. The skin disorder is psoriasis, contact dermatitis, atopic dermatitis, seborrabic dermatitis, nummular dermatitis, generalised exfoliative dermatitis or eczema. The invention effectively modulates critical costimulatory molecules such as the B7 protein. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating an inflammatory skin disorder such as psoriasis comprises topically applying an antisense compound targeted to the nucleic acid encoding human B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gapa

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense year therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entisinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine. In subject, stissue, or treducing levels of ubiquinone or lung surfactant in a subject, stissue, or required profice or condition. Unug allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed profit of appecification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypetide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in artisense gene therapy. The composition may have a cust in a respiratory effect of an antiinflammatory steading or therapeutic respiratory effect of an antiinflammationy bronchodilation, increasing levels of adenosine creeptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

31-OCT-2002

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an ratinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialragic, antiasthmatic, hypotenaive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject of treating by such control of the subject of subject of the subject of subject of the subject of subject of lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO Sequence 20 BP; 5 A; 8 C; 4 G; 3 T; 0 U; 0 Other; at ftp.wipo.int/pub/published\_pct\_sequences Disclosure; SEQ ID NO 4304; 872pp; English.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coling region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlenamatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pot_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a cue in antisense gene therapy. The composition may have a mininflammatory steroid in a subject, for reducing or receptor or therapeutic respiratory effect of an antisinflammatory steroid in a subject, for reducing or depleting levels of committees of composition are producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchodilation, lung allergies, or a respiratory disease or condition. Unug inflammation, but was obtained in electronic format directly from WIPO
